STATE OF THE ART REVIEW

Lung Ultrasound for the Diagnosis and Management of Acute Respiratory Failure

Marjan Islam¹ · Matthew Levitus² · Lewis Eisen² · Ariel L. Shiloh² · Daniel Fein¹

Table 2 Integration of the foundational sonographic signs for the accuracy of lung ultrasound in the diagnosis of thoracic conditions

	Foundational Sonographic signs	Sensitivity	Specificity	Clinical notes
Pneumothorax [20–23]	(–) Lung sliding (–) B-lines (+) A-lines (+) Lung point	US: 78–90% CR: 39–52%	US: > 98% CR: > 98%	Differential also includes pleural adhesion, emphysema; lung point is diagnostic of pneumothorax
Interstitial syndrome [28–31]	<i>CPE</i> : (+) B-lines [diffuse] (+) Normal pleural line (+) Lung sliding	US: 85–94% CR: 73%	US: 90–92% CR: 90%	Accuracy increases if combined with high pre-test probability of <i>CPE</i>
Pneumonia [35, 36, 70]	(+) B-lines [focal] (+) B-lines with (–) lung sliding (+) Alveolar consolidation (+) Static/dynamic Air-bronchogram	US: 94–97% CR: 77%	US: 90–96% CR: 91%	Combination of dynamic air-bronchogram with subpleural consolidation yields highest specificity
Pulmonary embolism [8, 43]	(+) Subpleural consolidation (+) A-lines with (+) DVT	US: 60.9% US: 81%	US: 95.9% US: 99%	If Wells > 4 or (+) D-dimer Compared to helical CT scan
Endotracheal intubation [46]	–	US: 98.7%	US: 97.1%	Ultrasound allows direct real-time visualization of ETT passing through vocal cords
Diaphragm dysfunction [63, 64]	Diaphragm excursion < 10–15 mm Diaphragm Thickening Fraction < 30%	US: 75–85%	US: 74–75%	Studies were heterogeneous in timing of diaphragm scanning and definition of extubation failure

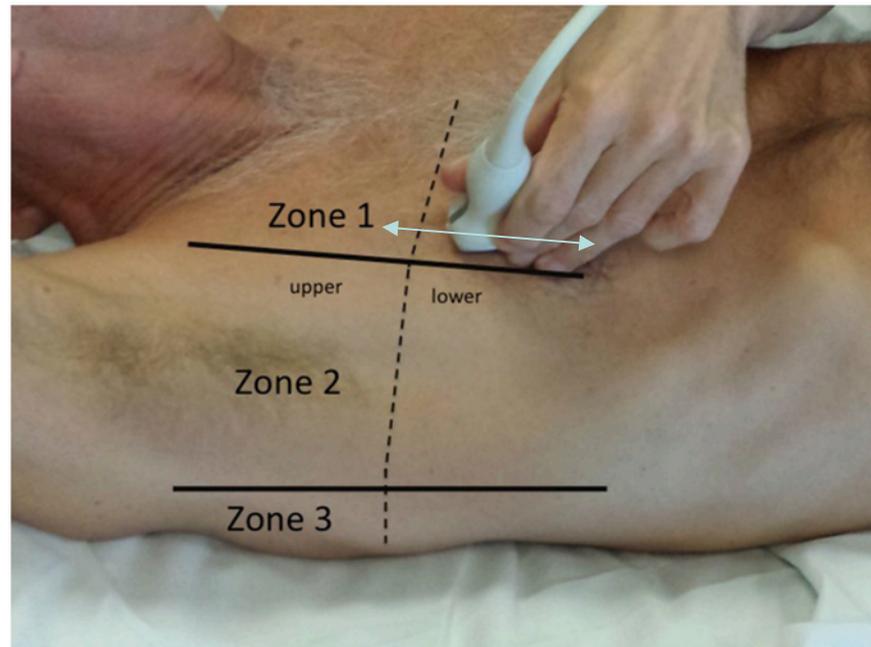

ARDS acute respiratory distress syndrome, *CPE* cardiogenic pulmonary edema, *NCPE* non-cardiogenic pulmonary edema, *US* ultrasound, *CR* chest radiography, *CT* computed tomography, *ETT* endotracheal tube

Echographie pleuro pulmonaire

^b	Corr sign at the 0.05 level.															

Simpson single-plane method of the four-chamber view. AVPDm, atrioventricular plane displacement, mean value of septal, lateral, anterior, inferior measurements; EBEF, eyeball ejection fraction; LVOT VTI, velocity time integral in the left ventricular outflow tract; TDIs, pulsed tissue Doppler imaging, systolic velocity of the septal portion of the mitral annulus; Spearman rank correlation was used, and for differences between two groups, Mann-Whitney *U* test was used. *P* values have been corrected by the Bonferroni method.

Bergenzaun L, Gudmundsson P, Öhlin H, Düring J, Ersson A, Ihrman L, et al. Assessing left ventricular systolic function in shock: evaluation of echocardiographic parameters in intensive care. Crit Care. 2011;15(4):R200.

■ FEVG visuelle

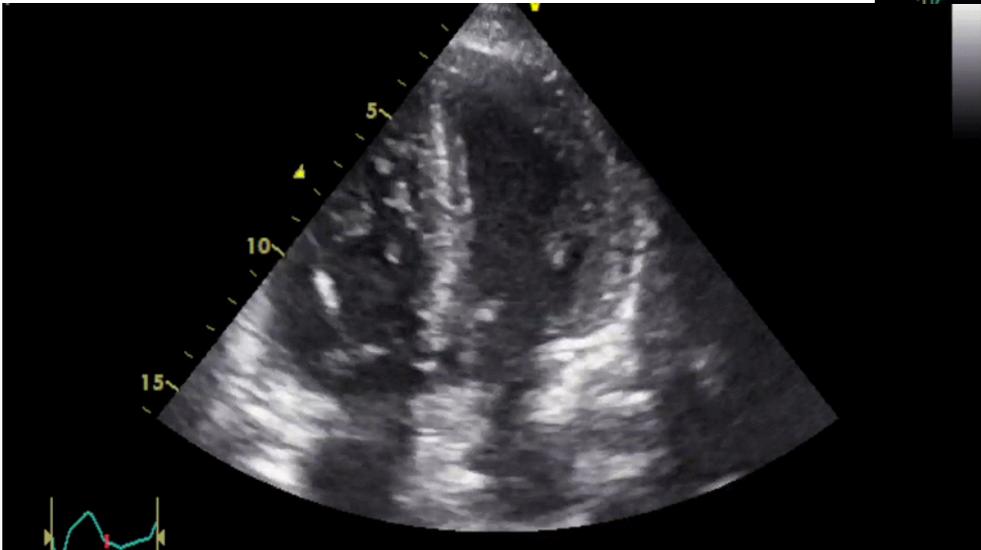

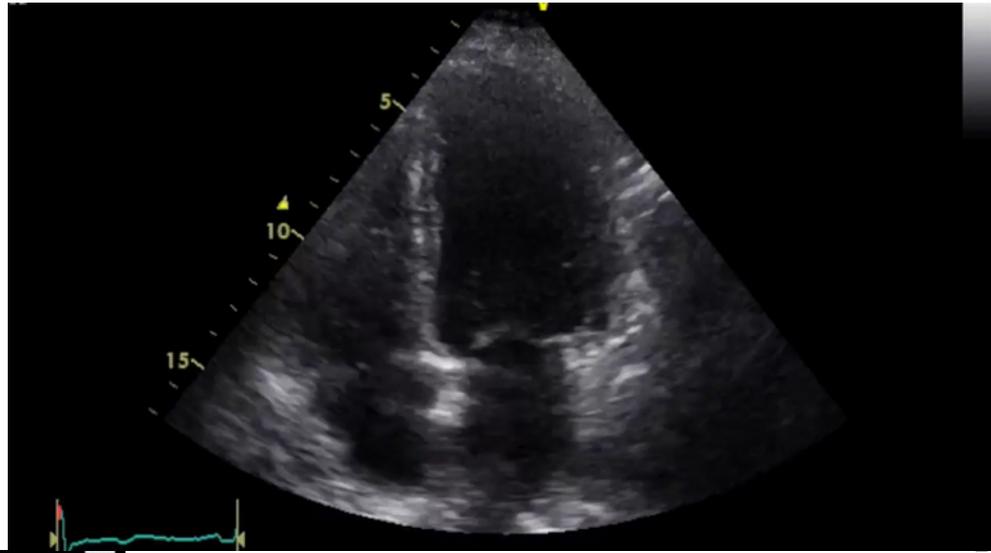

- Normal ($> 50\%$)
- Altérée ($35 - 50\%$)
- Effondrée ($< 35\%$)

Thomas BOISHARDY

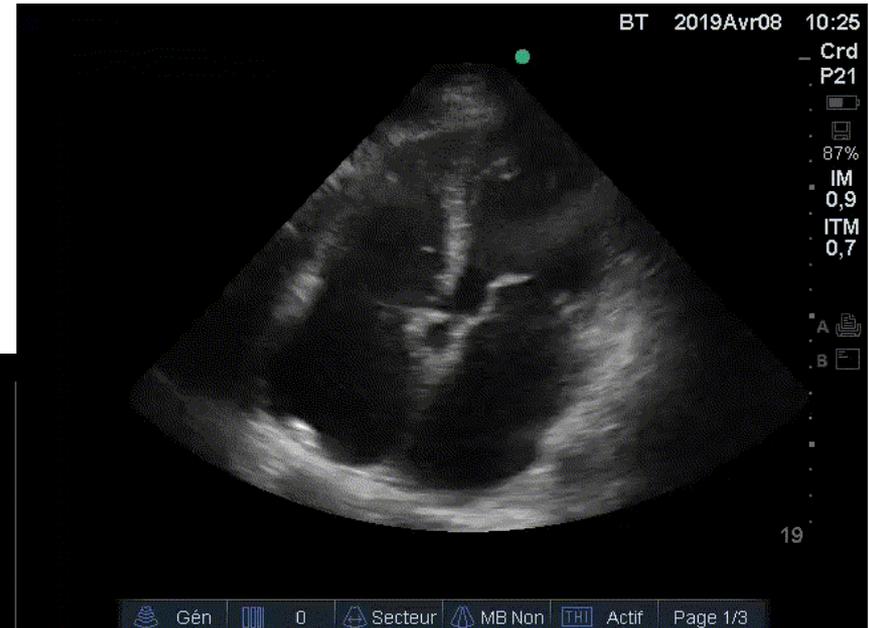

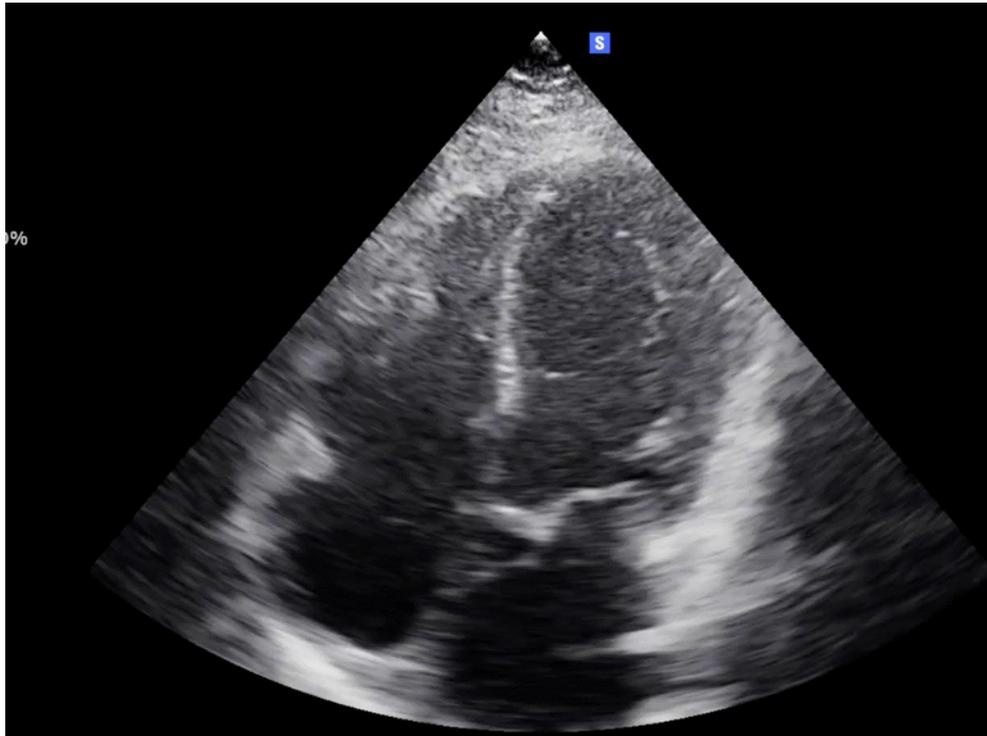

■ FEVG visuelle

- Normal ($> 50\%$)
- Altérée ($35 - 50\%$)
- Effondrée ($< 35\%$)

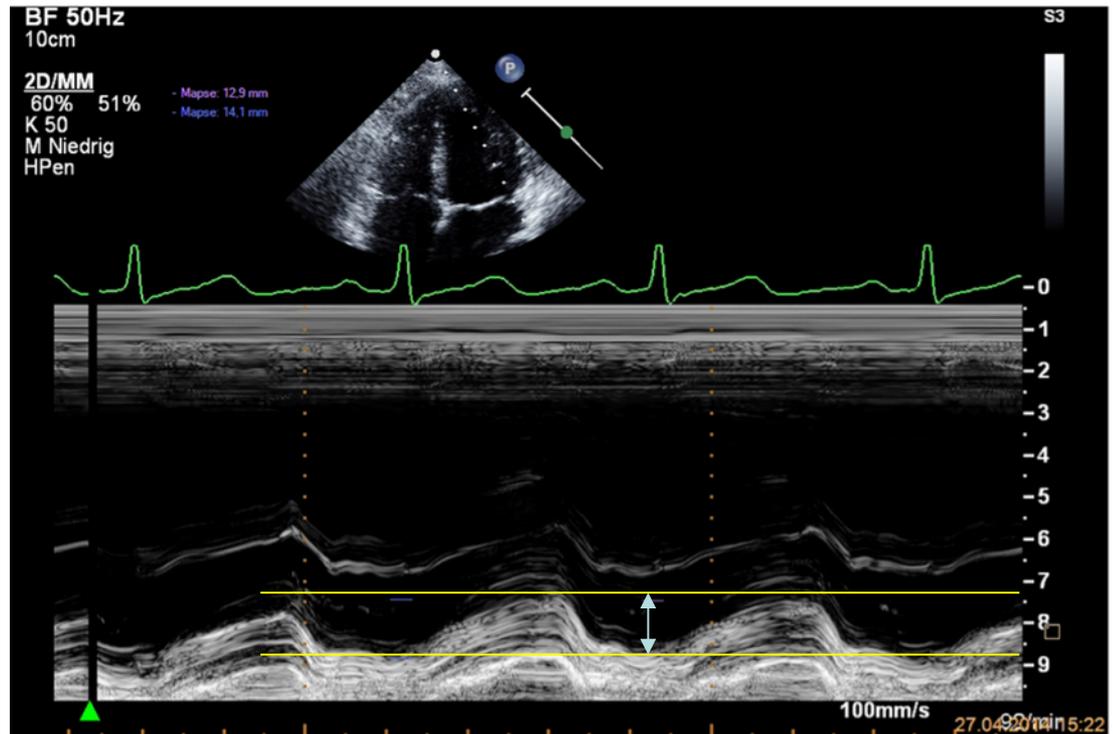

■ FEVG visuelle

- Normal (> 50%)
- Altérée (35 - 50%)
- Effondrée (< 35%)

■ MAPSE (Mitral Annulus Plane Systolic Excursion)

- Mode M
- Mesure en cm
- Corrélé à la FEVG
 - > 10 cm : normale
 - 8-10 : altérée
 - < 7 cm : effondrée

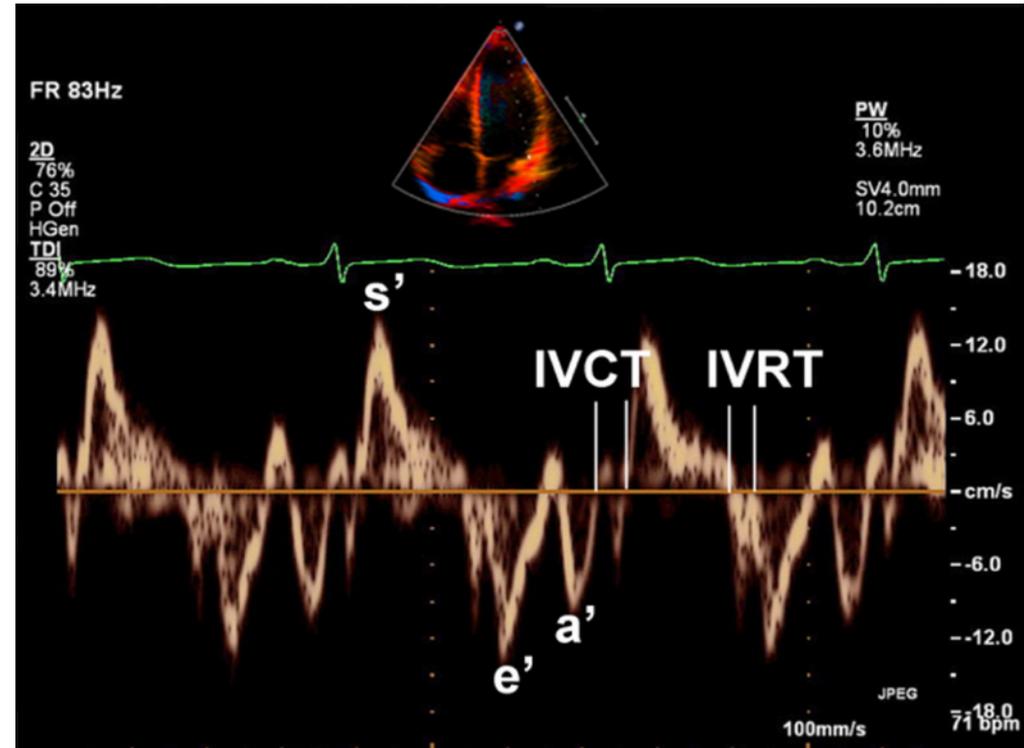

Hu K et al. Clinical implication of mitral annular plane systolic excursion for patients with cardiovascular disease. *European Heart Journal - Cardiovascular Imaging*. 1 mars 2013;14(3):205-12.

Huang SJ et al. Longitudinal wall fractional shortening: an M-mode index based on mitral annular plane systolic excursion (MAPSE) that correlates and predicts left ventricular longitudinal strain (LVLS) in intensive care patients. *Crit Care*. déc 2017;21(1):292.

■ Onde S'

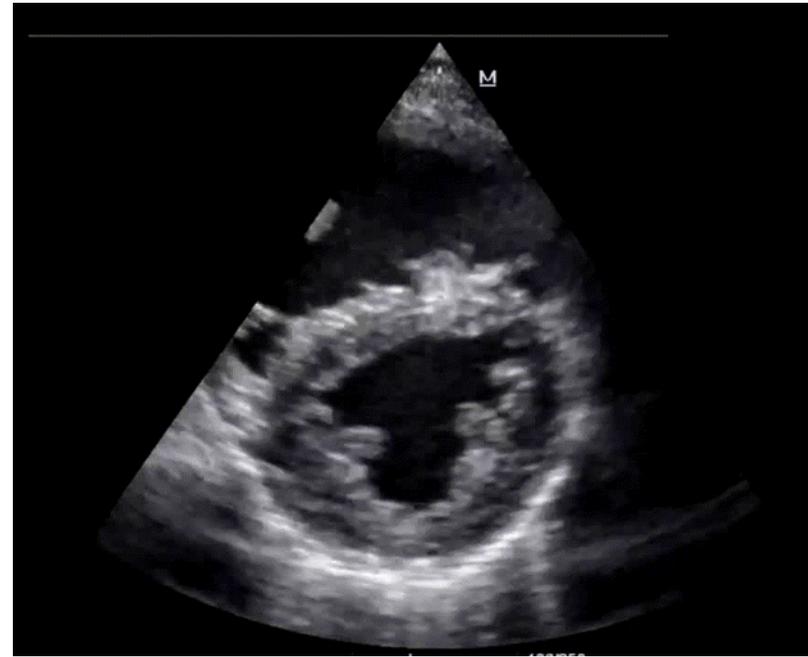

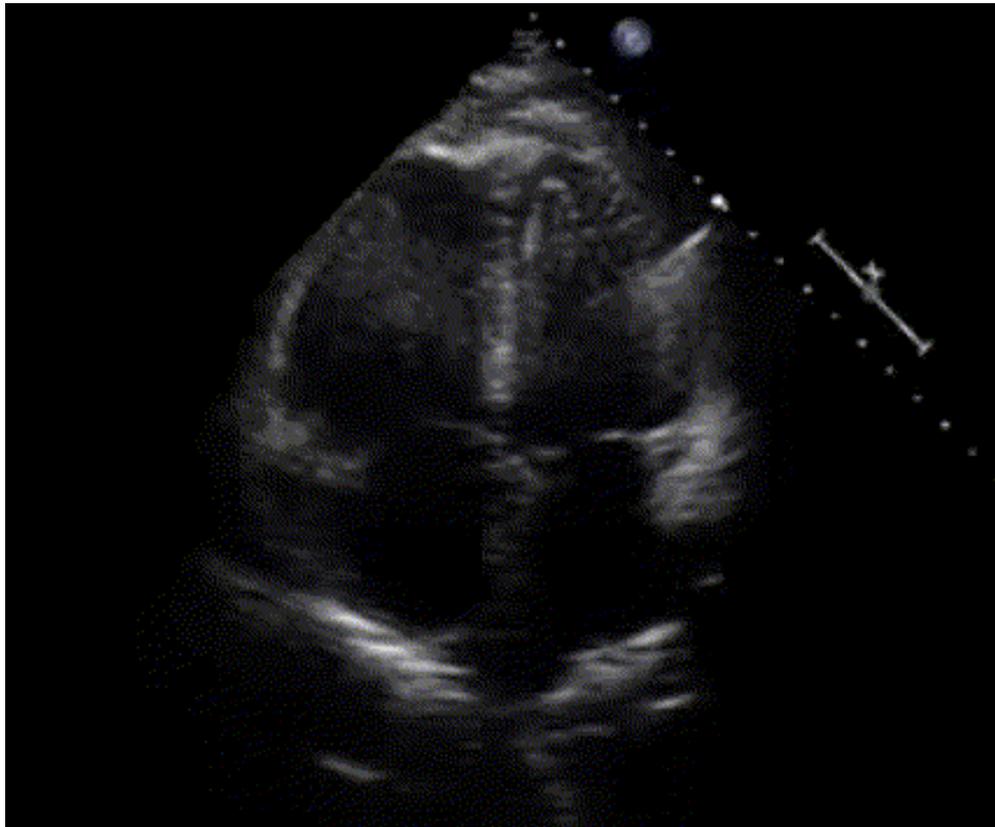

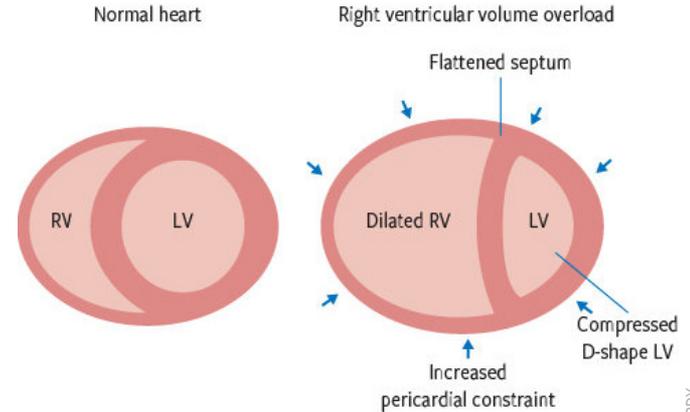

- Doppler tissulaire
- Basse vitesse : $\text{cm}\cdot\text{s}^{-1}$
- Valeur
 - FEVG normale : $> 8 \text{ cm}\cdot\text{s}^{-1}$
 - FEVG altérée : $6 - 8 \text{ cm}\cdot\text{s}^{-1}$
 - FEVG effondrée : $< 6 \text{ cm}\cdot\text{s}^{-1}$

Duzenli MA, Ozdemir K, Aygul N, Altunkeser BB, Zengin K, Sizer M. Relationship between Systolic Myocardial Velocity Obtained by Tissue Doppler Imaging and Left Ventricular Ejection Fraction: Systolic Myocardial Velocity Predicts the Degree of Left Ventricular Dysfunction in Heart Failure. *Echocardiography*. 2008;25(8):856-863. doi:10.1111/j.1540-8175.2008.00694.x

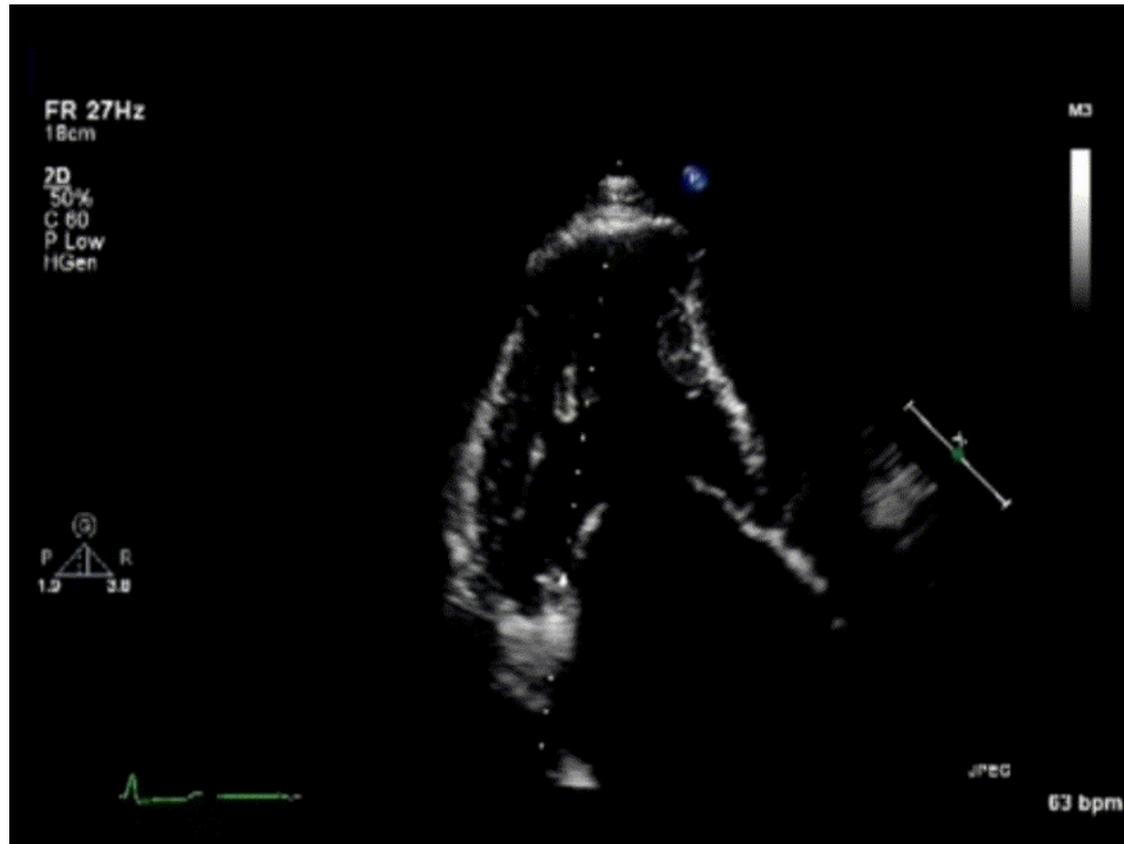

■ Evaluation du VD

- Dilatation Ventricule Droit ($VD/VG > 1$)
- Septum Paradoxal

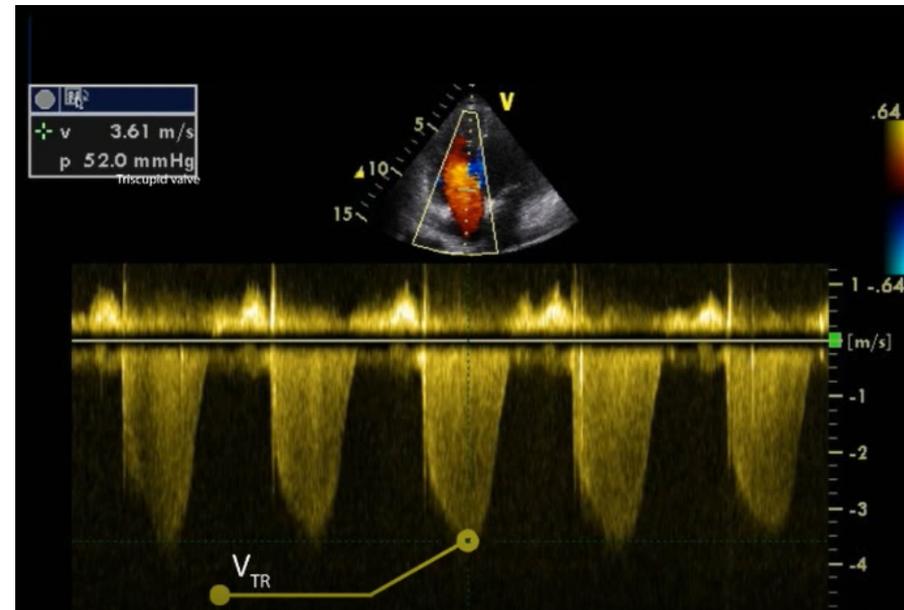

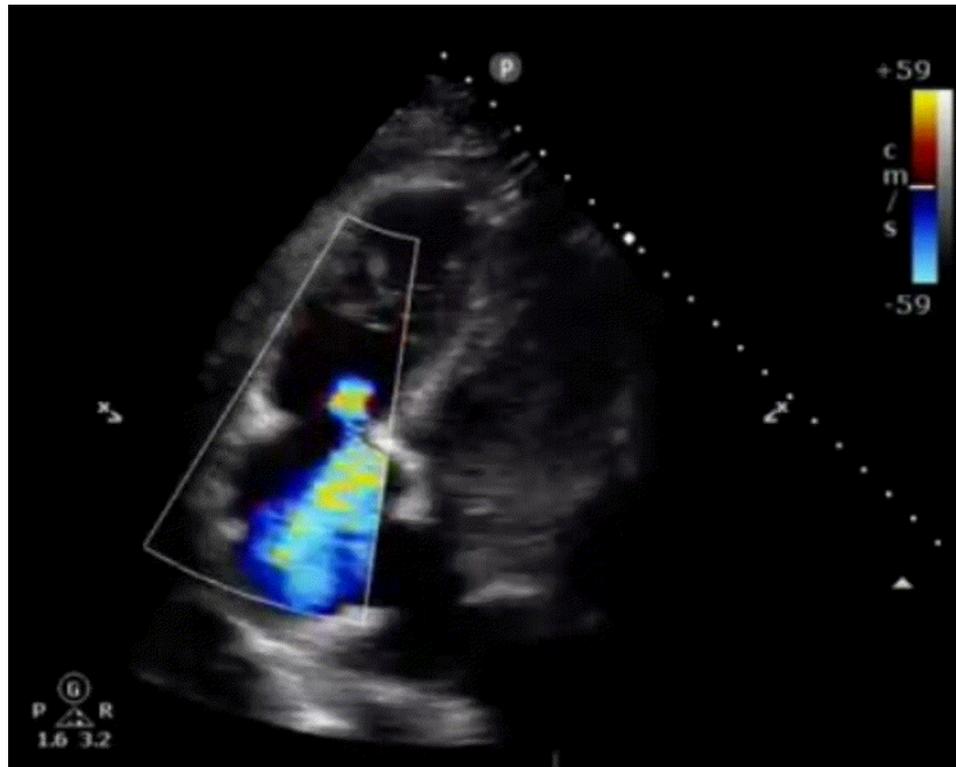

■ Evaluation du VD

- FEVD (TAPSE)
- N > 16 mm

■ Evaluation du VD

- Insuffisance Tricuspidienne -> mmHg
- Physiologique chez 50% de la population

$$\Delta P = 4 \times (V_{\max})^2$$

■ Evaluation du VD

- Insuffisance tricuspидienne
- FEVD (TAPSE)
- PAPs ?

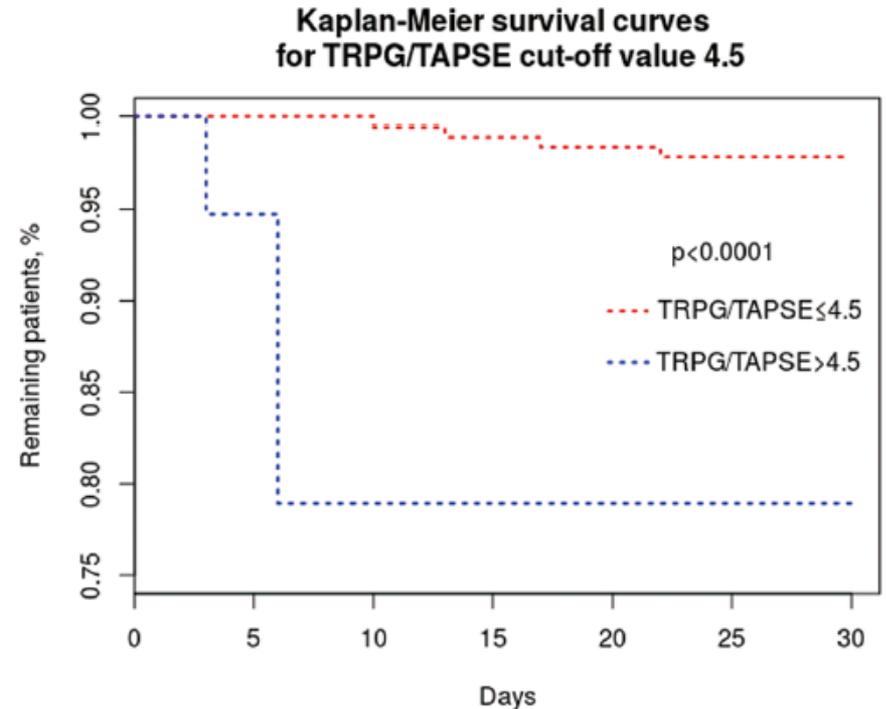

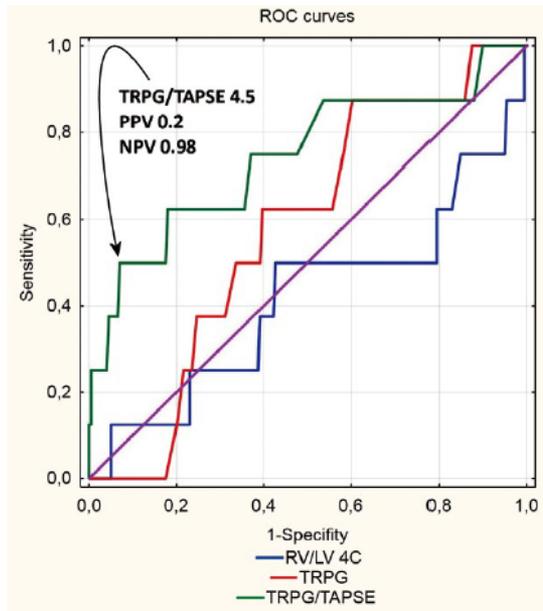

Figure 3. Kaplan-Meier curves according to TRPG/TAPSE in 207 patients with TAPSE ≤ 20 mm. Abbreviations as in Figure 1.

Ciurzyński M, Kurnicka K, Lichodziejewska B, et al. Tricuspid Regurgitation Peak Gradient (TRPG)/Tricuspid Annulus Plane Systolic Excursion (TAPSE) — A Novel Parameter for Stepwise Echocardiographic Risk Stratification in Normotensive Patients With Acute Pulmonary Embolism —. *Circ J.* 2018;82(4):1179-1185. doi:10.1253/circj.CJ-17-0940

■ Cœur pulmonaire aigu vs chronique ?

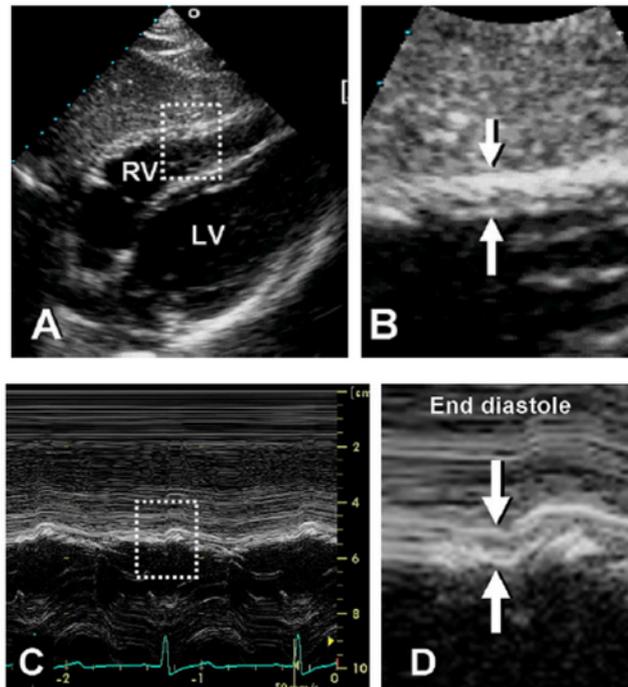

→ PAPs

- PAPs = ΔP + POD
- < 40 - 50 mmHg => aigu

Martinez M, Duchenne J, Bobbia X, et al. Deuxième niveau de compétence pour l'échographie clinique en médecine d'urgence. Recommandations de la Société française de médecine d'urgence par consensus formalisé. Ann Fr Med Urgence. 2018;8(3):193-202. doi:10.3166/afmu-2018-0047

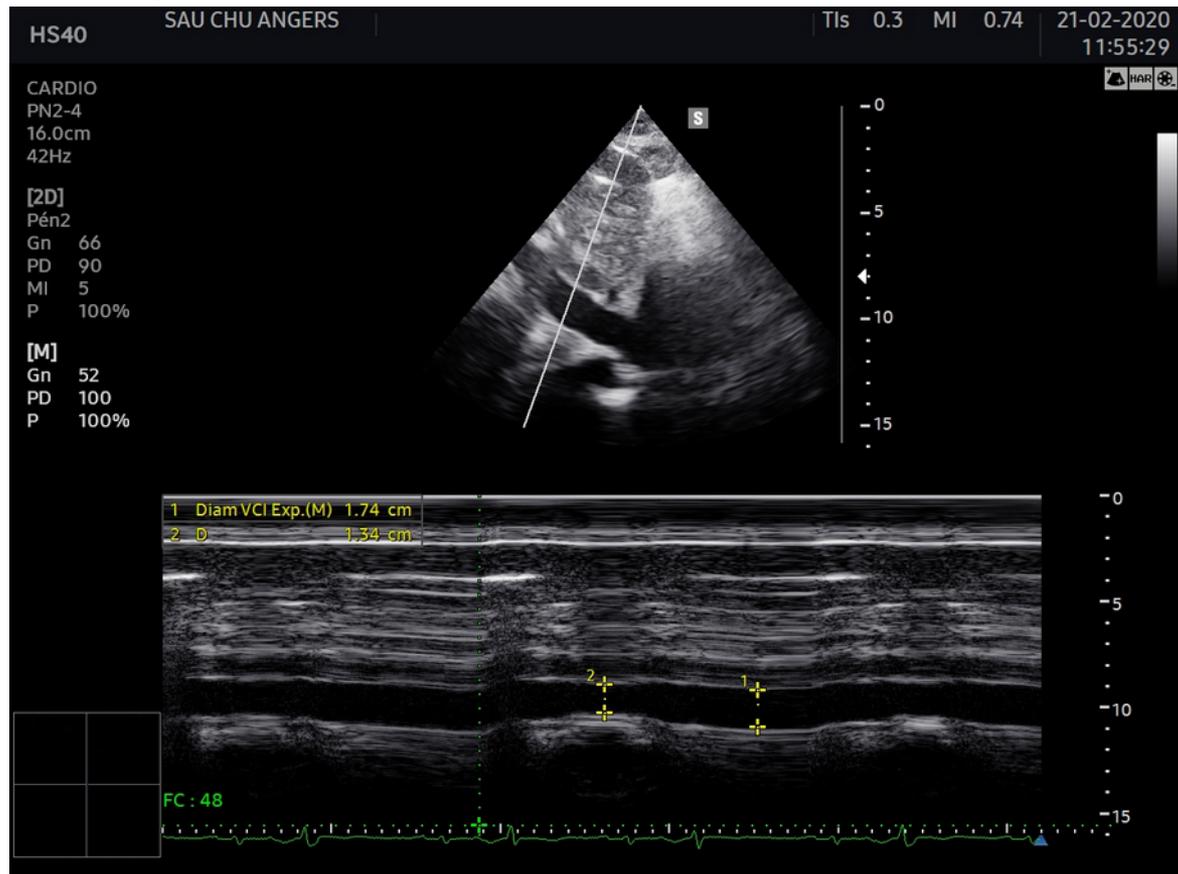

→ Epaisseur VD

- Fenêtre sous xiphoïdienne
- Mode B ou TM
- $N \leq 5\text{mm}$

■ Veine cave inférieure

- Mode B
- Fenêtre Sous Xiphoïdienne

■ Veine cave inférieure

→ Se mesure à ~2cm de l'oreillette

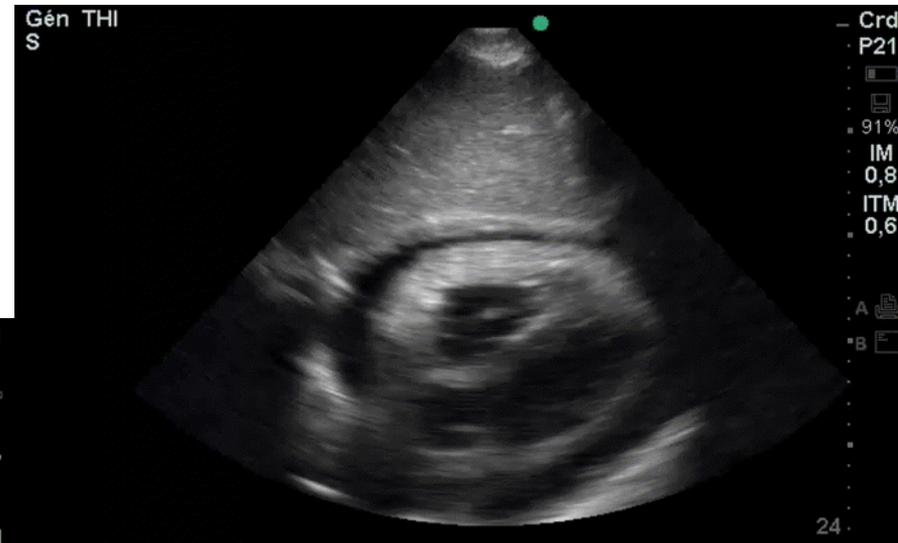

Diamètre VCI (mm)	DVCI (%)	POD (mmHg)
Bas (< 15)	100	0-5
Normal (15-25)	> 50	6-10
	< 50	11-15
Haut (> 25)	< 50	16-20
	Absente	> 20

Wong SP OC. Echocardiographic findings in acute and chronic pulmonary disease. In : The practice of clinical echocardiography. Philadelphia : WB Saunders Company ; 2002. p.739-60

■ Epanchement péricardique

- Rare, ~2% des patients consultant pour dyspnée
- Intérêt pronostic
- Diagnostic US facile (mode B)

Zanobetti M, Scorpiniti M, Gigli C, et al. Point-of-Care Ultrasonography for Evaluation of Acute Dyspnea in the ED. *Chest*. 2017;151(6):1295-1301. doi:[10.1016/j.chest.2017.02.003](https://doi.org/10.1016/j.chest.2017.02.003)

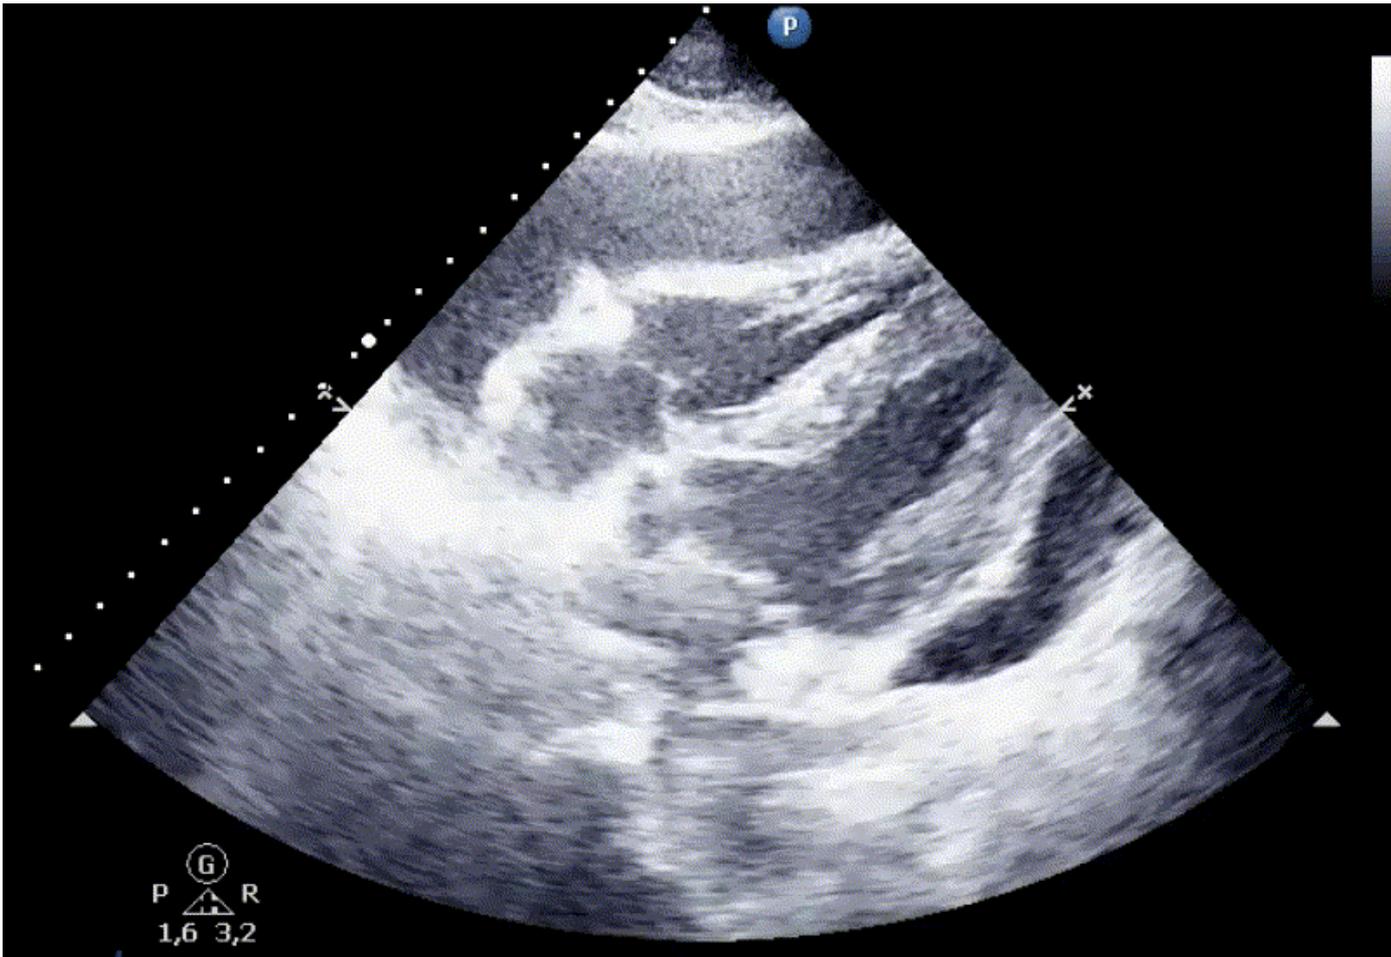

■ Epanchement péricardique

- Significatif en diastole uniquement
- < 100cc : en systole uniquement, postérieur
- 100-300cc : systolo diastolique, postérieur
- > 300cc : systolo diastolique, antéro postérieur
- 300-500cc : 1 à 2cm antéro-postérieur
- > 500cc : > 2cm en antérieur

■ Tamponnade

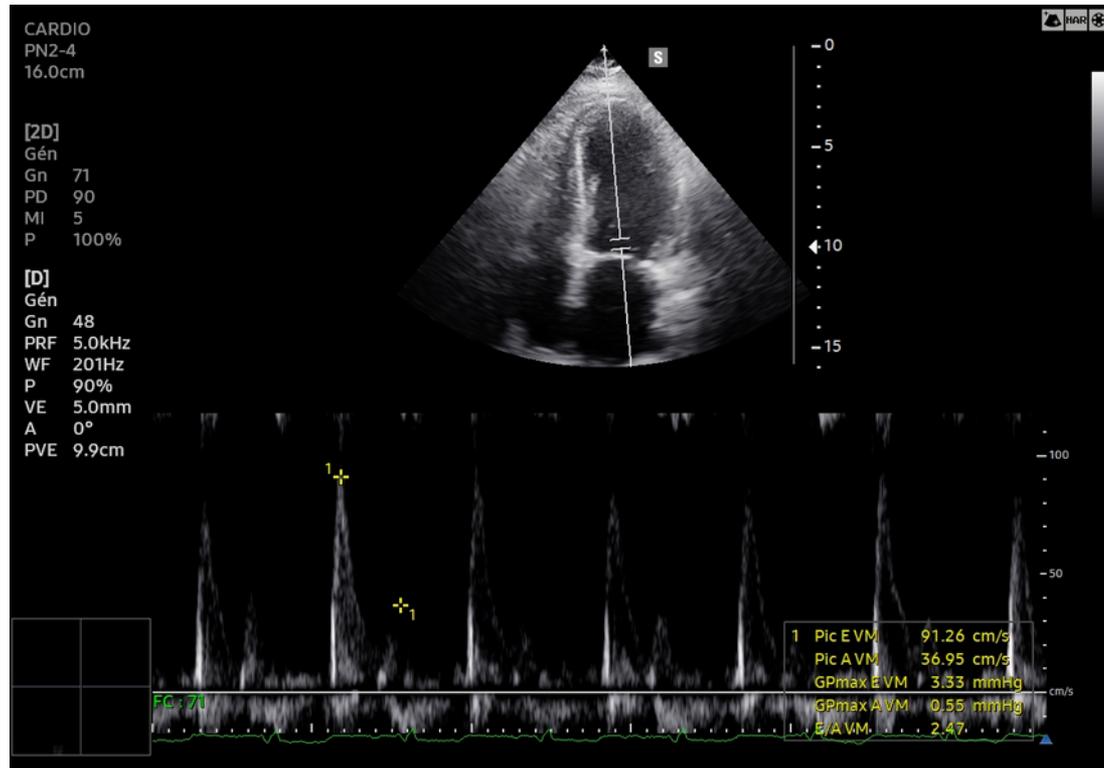

- Epanchement péricardique circonférentiel
- Collapsus télédiastolique de l'oreillette droite (Pré Tamponnade)
- Collapsus télédiastolique du ventricule droit
- VCI dilaté, non « respirante »

■ Tamponnade

■ Doppler mitral

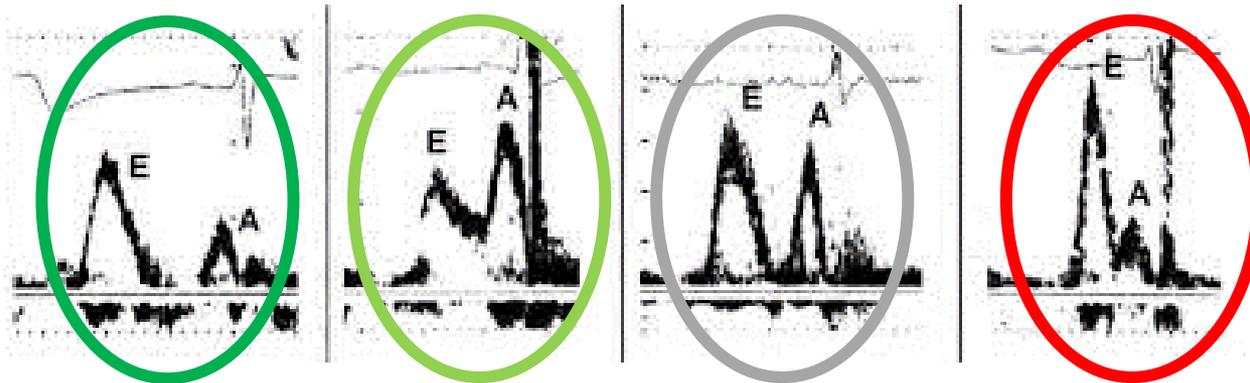

- Evaluation des pressions de remplissage du VG
- Fenêtre apicale, Coupe 4 cavités
- Doppler pulsé (fenêtre : extrémité des valves ouvertes)

■ Doppler mitral

→ Profil mitral (varie avec l'âge) :

- Onde E : remplissage passif VG
- Onde A : remplissage actif VG (contraction oreillette)

$E/A > 2$
 $\Rightarrow \nearrow P^{\circ}$ gauches

Tableau 1 : Valeurs normales du flux mitral. TDE = temps de décélération de l'onde E

Âge	2-20 ans	21-40 ans	41-60 ans	> 60 ans
Onde E (cm/s)	88 ± 14	75 ± 13	71 ± 14	71 ± 11
Onde A (cm/s)	49 ± 12	51 ± 11	57 ± 13	75 ± 12
Rapport E/A	1,88 ± 0,45	1,53 ± 0,40	1,28 ± 0,25	0,96 ± 0,18
TDE (ms)	142 ± 19	166 ± 14	181 ± 19	200 ± 29

■ Doppler mitral

Diastolic Function in Patients With Heart Failure and a Normal Ejection Fraction

	Average \pm SD	Range	Abnormal, %
LV pressure			
EDP, mm Hg	27 \pm 7	7–48	92 (>16)
τ , ms	59 \pm 15	32–110	79 (>48)
Echocardiography			
IVRT, ms	96 \pm 22	55–153	38 (>105)
E, mm/s	74 \pm 22	32–131	40 (<70)
DT, ms	349 \pm 140	101–604	64 (>280)
A, mm/s	76 \pm 23	36–139	50 (>70)
E/A ratio	1.0 \pm 0.4	0.4–2.4	48 (<1.0)

τ indicates relaxation time constant; E, peak E velocity; DT, deceleration time; and A, peak A velocity.

- Tableau d'insuffisance cardiaque
 - 45% dysfonction diastolique
 - En augmentation
 - Absence de thérapeutique spécifique

WRITING GROUP MEMBERS, Lloyd-Jones D, Adams RJ, et al. Heart Disease and Stroke Statistics —2010 Update: A Report From the American Heart Association. *Circulation*. 2010;121(7). doi:[10.1161/CIRCULATIONAHA.109.192667](https://doi.org/10.1161/CIRCULATIONAHA.109.192667)

Zile MR, Gaasch WH, Carroll JD, et al. Heart Failure With a Normal Ejection Fraction: Is Measurement of Diastolic Function Necessary to Make the Diagnosis of Diastolic Heart Failure? *Circulation*. 2001;104(7):779-782. doi:[10.1161/hc3201.094226](https://doi.org/10.1161/hc3201.094226)

■ Doppler tissulaire

→ Intérêt

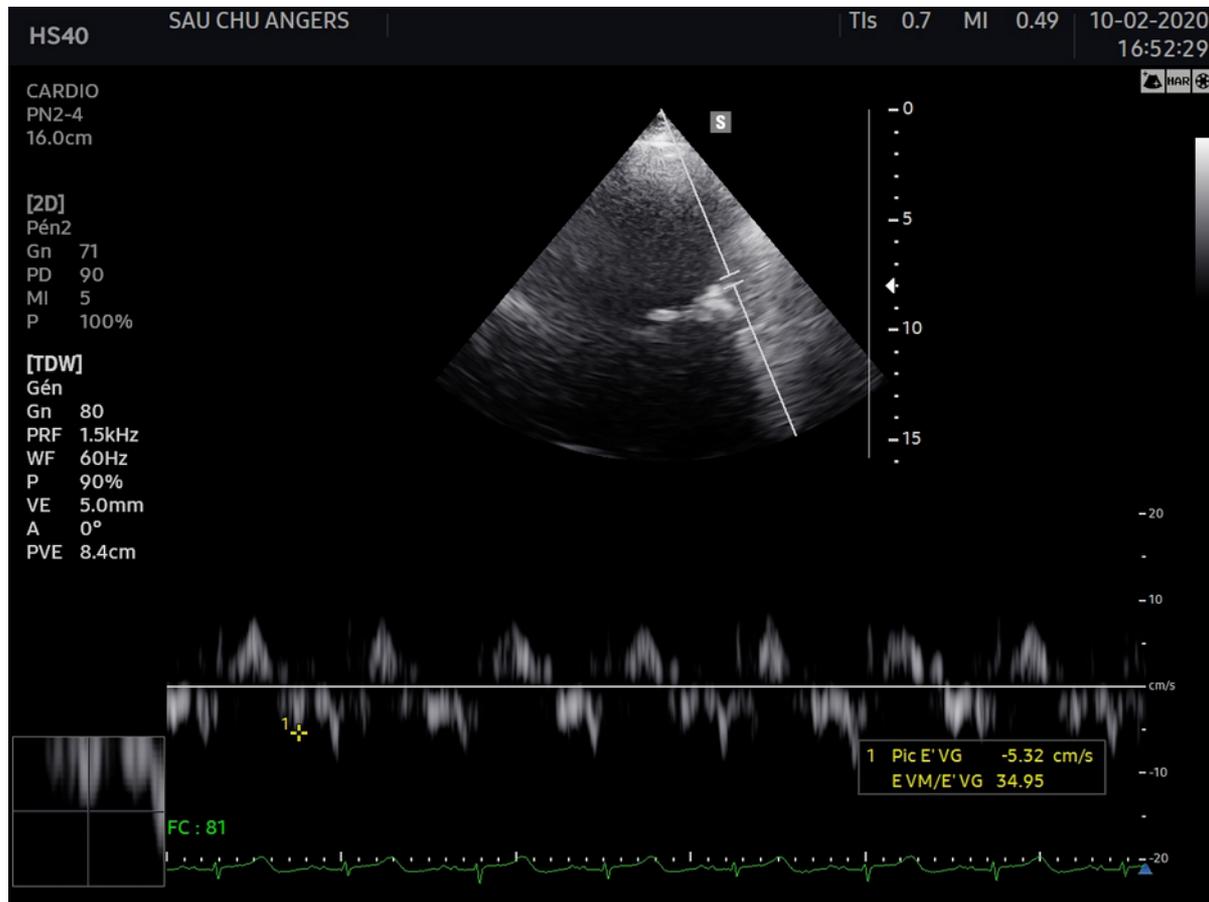

- Ne pas méconnaître une insuffisance cardiaque à FEVG préservée
- Evaluation des pressions de remplissages dans la FA

→ Valeur

- E : dépend de la précharge gauche & de la relaxation
- E'(Ea) : dépend de la relaxation VG, indépendant de la précharge
 - Normal $> 10\text{cm.s}^{-1}$
 - $< 10\text{cm.s}^{-1}$: insuffisance cardiaque diastolique
- E/E' : dépend uniquement de la précharge
 - > 15 : augmentation des pressions gauches
 - < 9 : normal
 - 8 - 15 : zone grise

■ Doppler tissulaire

- Vitesse de déplacement du tissu myocardique
- Filtre basses fréquence

ECHOVEINOGRAPHIE

■ Rationnel

- Phlébite : présentation clinique hétérogènes
- Aucun signe clinique sensible, ni spécifique
- Disponibilité Echo-Doppler veineux aléatoire

■ Echographie 4 points

- Se : 70-100% ; Sp : 78-100%
- Sonde linéaire, haute fréquence
- Mode B
- Fenêtre
 - Inguinale Dte et Gche
 - Poplitée Dte et Gche

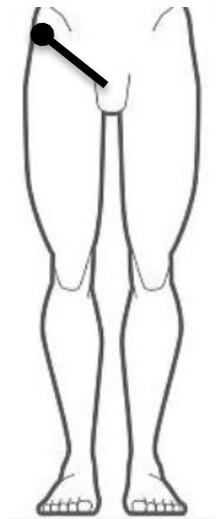

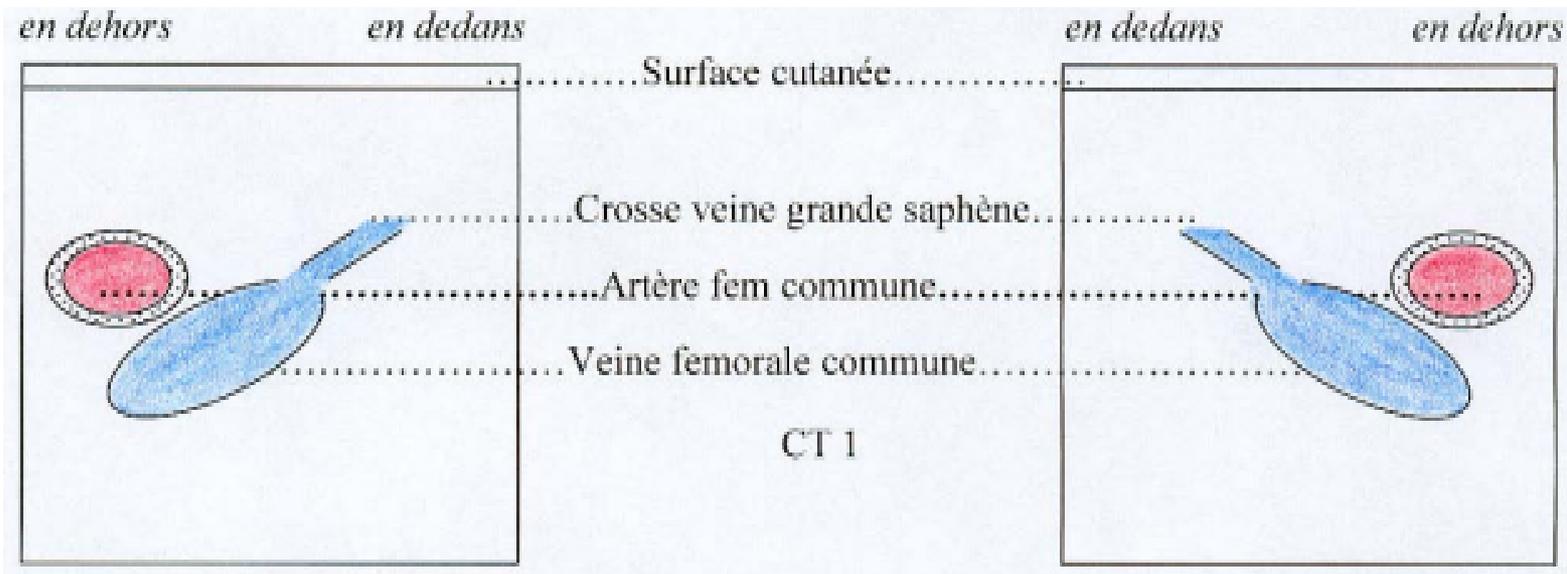

■ Veine normale

- Vide d'écho
- Paroi fine et souple
- Elle se laisse déprimer, jusqu'à s'effacer complètement

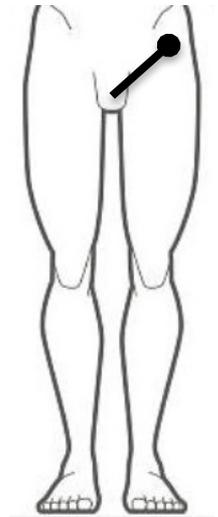

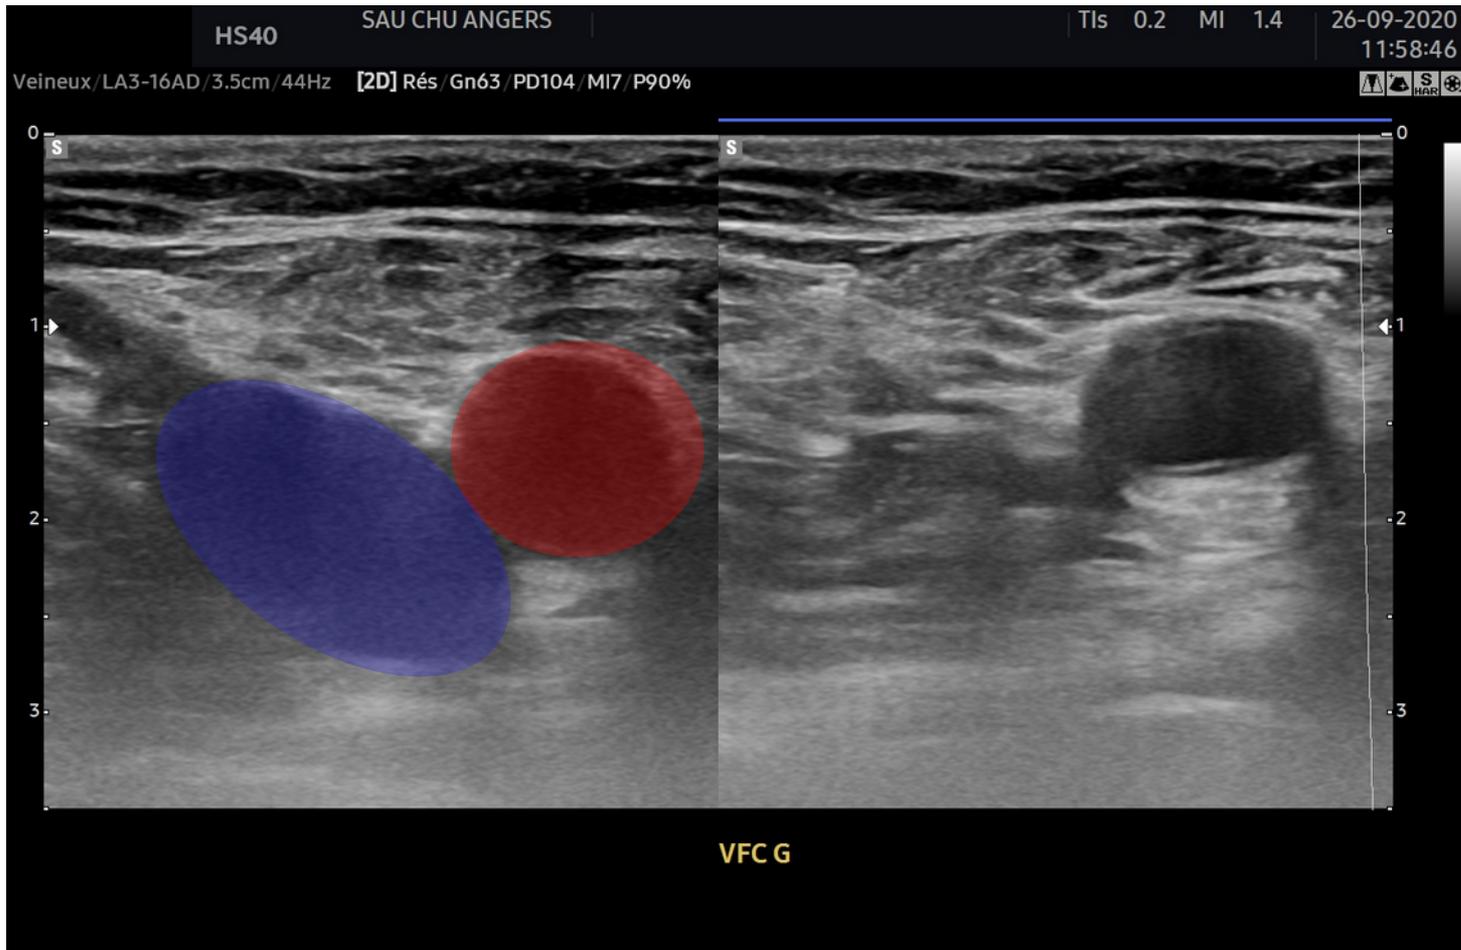

■ Veine thrombosée

- PERTE DE COMPRESSIBILITE

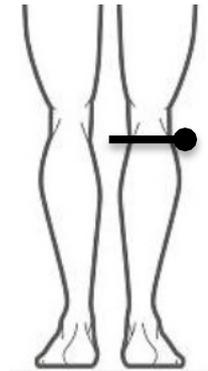

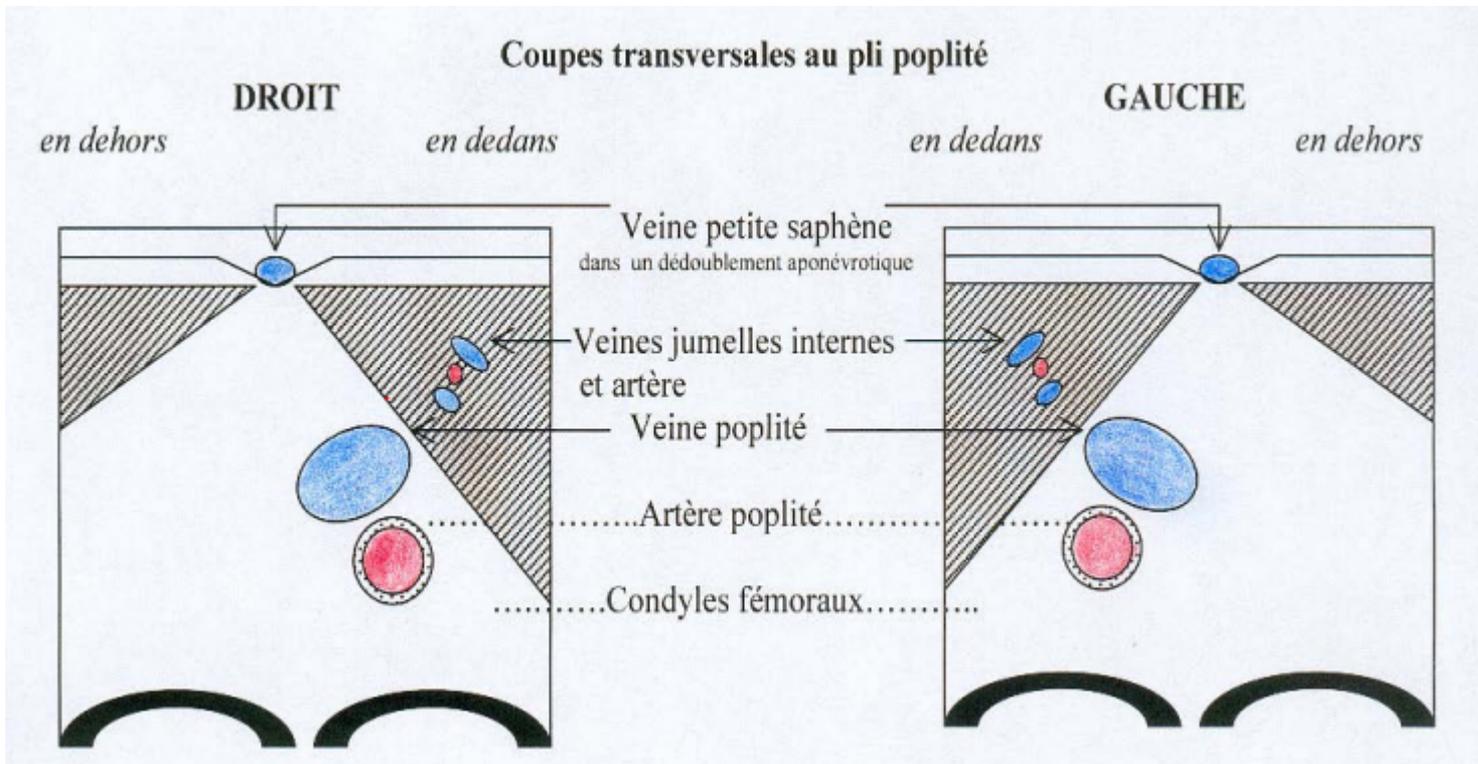

■ Fenêtres inguinales

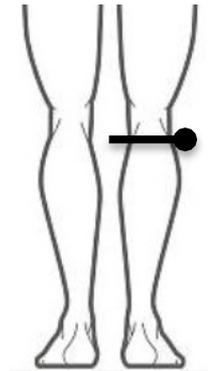

■ Fenêtres inguinales
